# You're studying A-level Chemistry, congratulations!

Studying chemistry afteryourGCSEs really develops your practical and mathematical skills. If you enjoy experimenting in the lab, you'll love it.

At first, you may find the jump in demand from GCSE a little daunting, but if you follow the tips and advice in this guide, you'll soon adapt.

We recommend you keep this somewhere safe, as you may like to refer to the information inside throughout your studies.

# Why study A-level Chemistry?

Chemistry students get to investigate a huge range of ideas: the big question you'll ask yourself is 'what is the world made of?' If you choose it as career, you have the potential to help solve all sorts of problems. You could work on a cure for cancer, or you might develop a new food: the possibilities are endless.

Even if you don't decide to work in chemistry, studying it still develops useful and transferable skills for other careers. You'll develop research, problem solving and analytical skills, alongside teamwork and communication. Universities and businesses regard all of these very highly.

# Possible degree options

According to <u>best course4me.com</u>, the top five degree courses taken by students who have A-level Chemistry are:

- Chemistry
- Biology
- Pre-clinical medicine
- Mathematics
- Pharmacology.

For more details, go to the <u>bestcourse4me.com</u> website, or <u>UCAS</u>.

# Which career appeals to you?

 $Studying \, Chemistry \, at \, A-level \, or \, degree \, opens \, up \, plenty \, of \, career \, opportunities, \, such \, as: \, and \, career \, opportunities, \, such \, as: \, and \, career \, opportunities, \, car$ 

- analytical chemist
- chemical engineer
- clinical biochemist
- pharmacologist
- doctor
- research scientist (physical sciences)
- toxicologist
- environmental consultant
- higher education lecturer or secondary school teacher
- patent attorney
- science writer.

### Specification at a glance

#### AS and A-level

#### Physical chemistry

- Atomic structure
- Amount of substance
- Bonding
- Energetics
- Kinetics
- Chemical equilibria, Le Chatelier's principle and K<sub>c</sub>
- Oxidation, reduction and redox equations

#### Inorganic chemistry

- Periodicity
- Group 2, the alkaline earth metals
- Group 7 (17), the halogens

#### Organic chemistry

- Introduction to organic chemistry
- Alkanes
- Halogenoalkanes
- Alkenes
- Alcohols
- Organic analysis

## A-level only topics

#### Physical chemistry

- Thermodynamics
- Rate equations
- Equilibrium constant K<sub>p</sub> for homogeneous systems
- Electrode potentials and electrochemical cells
- Acids and bases

#### Inorganic chemistry

- Properties of Period3 elements andoxides
- Transition metals
- Reactions of ions in aqueous solution

#### Organic chemistry

- Optical isomerism
- Aldehydes and ketones
- Carboxylic acids and derivatives
- Aromatic chemistry
- Amines
- Polymers
- Amino acids, proteinsand DNA
- Organic synthesis
- NMR spectroscopy
- Chromatography

# Places to go for help

#### 1. OCR website.

#### 2. The Royal Society of Chemistry (RSC)

The RSC do everything from naming new elements and lobbying MPs, to improving funding for research sciences in the UK.

You'll find lots of handy resources on their website.

#### 3. The student room

Join the A-level Chemistry forums and share thoughts and ideas with other students if you're stuck with your homework. Just be very careful not to share any details about your assessments, there are serious consequences if you're caught cheating. Visit <a href="mailto:thestudentroom.co.uk">thestudentroom.co.uk</a>

#### 4. Textbooks

#### 5. Revision guides

These are great if you want a quick overview of the course when you're revising for your exams. Remember to use other tools as well, as these aren't detailed enough on their own.

#### 6. YouTube

YouTube has thousands of Chemistry videos. Just be careful to look at who produced the video and why, because some videos distort the facts. Check the author, date and comments – these help indicate whether the clip is reliable. If in doubt, ask your teacher.

#### 7. Magazines

Focus, New Scientist or Philip Allan updates can help you put the chemistry you're learning in context

#### **Getting prepared**

All sciences at A-level are very demanding and require commitment, hard work and resilience. Here are a few activities to prepare you for this course

Complete this course in which you will learn the physical

processes behind climate variation around the world to better understand the causes of climate change.

#### Causes of Climate Change

University of Bergen and Bjerknes Centre for Climate Research

Listen to this radio programme which explores

why NASA's third bid to land on the moon was flawed from the start.

13 Minutes to the Moon

and explore the diverse skills and knowledge required to be a nurse and find out where a career in nursing could take you.

Introduction to Nursing: Bioscience, Psychology, and Sociology

Listen to this radio programme which tackles the big issue of

lack of diversity in engineering. In the UK, 91% of jobs in the engineering industry are filled by men and 92% of jobs are filled by white people. So what can we do about it?

**BBC Live Wires** 

How can we make UK engineering more diverse? BBC Sounds

which examines the pharmaceutical industry and its impact on doctors and the wider medical world.

What doctors don't know about the drugs they prescribe TED Talk – Ben Goldacre

Complete this course which is ideal for anyone considering working in residential care homes or nursing. You will also learn about the 6 'Rs' of medicine administration: right patient, right medicine, right route,

right dose, right time and resident's right to refuse.

Understand the key principles of medicine administration University of East Anglia

# Useful information and activities

There are a number of activities throughout this resource. The answers to some of the activities are available on our secure website, e-AQA. Your teacher will be able to provide you with these answers.

#### **Greek letters**

Greek letters are used often in science. They can be used as symbols for numbers (such as  $\pi = 3.14...$ ), as prefixes for units to make them smaller

(eg µm = 0.000 000 001 m) or as symbols for particular quantities (such as  $\lambda$ which is used for wavelength).

The Greek alphabet is shown below.

| A | α | alpha |
|---|---|-------|
| В | β | beta  |
| Γ | γ | gamma |
| Δ | δ | delta |

| N   | N   | nu     |
|-----|-----|--------|
| [1] | [1] | ksi    |
| О   | O   | omicro |
|     |     | n      |
| Π   | Π   | pi     |

| E        | 3       | epsilon |
|----------|---------|---------|
| Z        | $\zeta$ | zeta    |
| Н        | η       | eta     |
| $\Theta$ | θ       | theta   |
| I        | ι       | iota    |
| K        | κ       | kappa   |
| Λ        | λ       | lambda  |
| M        | μ       | mu      |

| P | P                       | rho     |
|---|-------------------------|---------|
| Σ | $\varsigma$ or $\sigma$ | sigma   |
| T | T                       | tau     |
| Y | Y                       | upsilon |
| Φ | Φ                       | phi     |
| X | X                       | chi     |
| Ψ | Ψ                       | psi     |
| Ω | Ω                       | omega   |

# Activity 1

A lot of English words are derived from Greek ones, but it's difficult to see as the alphabet is so different.

Many of the Greek letters are pronounced like the start of their name. For example, omega is pronounced "o", sigma is pronounced "s" and lambda is pronounced "l".

See if you can work out what the following Greek words mean by comparing the phonetic spelling with similar English words.

| Πυθαγόρας   | Name of a            |
|-------------|----------------------|
|             | mathematician        |
| Ωκεανος     | Atlantic, Pacific or |
|             | Arctic               |
| μόνος       | Single               |
| Τηλε        | Far or distant       |
| Τρωγλοδύτης | Cave dweller         |

#### SI units

Every measurement must have a size (eg 2.7) and a unit (eg metres or °C). Sometimes there are different units available for the same type of measurement, for example ounces, pounds, kilograms and tonnes are allused as units for mass.

To reduce confusion and to help with conversion between different units, there is a standard system of units called the SI units which are used for most scientific purposes.

These units have all been defined by experiment so that the size of, say, a metre in the UK is the same as a metre in China.

The seven SI base units are:

| Physical quantity   | Usual quantity symbol | Unit     | Abbreviation |
|---------------------|-----------------------|----------|--------------|
| mass                | M                     | kilogram | kg           |
| length              | l  or  x              | metre    | m            |
| time                | T                     | second   | s            |
| electric current    | I                     | ampere   | A            |
| temperature         | T                     | kelvin   | K            |
| amount of substance | N                     | mole     | mol          |
| luminous intensity  | (not used at A-level) | candela  | cd           |

All other units can be derived from the SI base units.

For example, area is measured in square metres (written as  $\rm m^2$ ) and speed is measured in metres per second (written as  $\rm ms^{-1}$ ).

It is not always appropriate to use a full unit. For example, measuring the width of a hair or the distance from Manchester to London in metres would cause the numbers to be difficult to work with.

Prefixes are used to multiply each of the units. You will be familiar with centi (meaning 1/100), kilo (1000) and milli (1/1000) from centimetres, kilometres and millimetres.

There is a wide range of prefixes. The majority of quantities in scientific contexts will be quoted using the prefixes that are multiples of 1000. For example, a distance of 33 000  $\rm m$  would be quoted as 33  $\rm km$ .

The most common prefixes you will encounter are:

| Prefix | Symbol | Multipl                | Multiplication factor |                         |  |  |  |  |  |  |
|--------|--------|------------------------|-----------------------|-------------------------|--|--|--|--|--|--|
| Tera   | Т      | 10 <sup>12</sup>       | 1 000 000 000 000     |                         |  |  |  |  |  |  |
| Giga   | G      | <b>10</b> <sup>9</sup> | 1 000 000 000         |                         |  |  |  |  |  |  |
| Mega   | M      | 10 <sup>6</sup>        | 1 000 000             |                         |  |  |  |  |  |  |
| kilo   | k      | 10 <sup>3</sup>        | 1000                  |                         |  |  |  |  |  |  |
| deci   | d      | 10 <sup>-1</sup>       | 0.1                   | 1/10                    |  |  |  |  |  |  |
| centi  | С      | 10 <sup>-2</sup>       | 0.01                  | 1/100                   |  |  |  |  |  |  |
| milli  | m      | 10 <sup>-3</sup>       | 0.001                 | 1/1000                  |  |  |  |  |  |  |
| micro  | μ      | 10 <sup>-6</sup>       | 0.000 001             | 1/1 000 000             |  |  |  |  |  |  |
| nano   | n      | 10 <sup>-9</sup>       | 0.000 000 001         | 1/1 000 000 000         |  |  |  |  |  |  |
| pico   | p      | 10 <sup>-12</sup>      | 0.000 000 000 001     | 1/1 000 000 000 000     |  |  |  |  |  |  |
| femto  | f      | 10 <sup>-15</sup>      | 0.000 000 000 000 001 | 1/1 000 000 000 000 000 |  |  |  |  |  |  |

# Activity 2

Which SI unit and prefix would you use for the following quantities?

- 1. The mass of water in a test tube.
- 2. The time taken for a solution to change colour.
- 3. The radius of a gold atom.
- 4. The volume of water in a burette.
- 5. The amount of substance in a beaker of sugar.
- 6. The temperature of the blue flame from a Bunsen burner.

 $Sometimes, there \, are \, units \, that \, are \, used \, that \, are \, not \, combinations \, of \, SI \, \, units \, and \, prefixes.$ 

These are often multiples of units that are helpful to use. For example, one litre is 0.001  $\mathrm{m}^3$ .

| Activ | vity 3                         |
|-------|--------------------------------|
| Rewr  | ite the following in SI units. |

| 6.    | 10 cm <sup>3</sup> in litres   |

# Important vocabulary for practical work

There are many words used in practical work. You will have come across most of these words in your GCSE studies. It is important you are using the right definition for each word.

| Activity 5                     |  |
|--------------------------------|--|
| Join the boxes to link the wo  | ed to its definition   |
| Join the boxes to link the wor | a to its definition.   |
| Accurate                       | A statement suggesting what may happen in the future.  |
| Data                           | An experiment that gives the same results when a different   |
|                                | person carries it out, or a different technique or set of equipment is used.   |
| Precise                        | A measurement that is close to the true value.   |
| Prediction                     | An experiment that gives the same results when the same experimenter uses the same method and equipment.                                     |
| Range                          | Physical, chemical or biological quantities or characteristics.  |
| Repeatable                     | A variable that is kept constant during an experiment.   |
| Reproducible                   | A variable that is measured as the outcome of an experiment.   |
| Resolution                     | This is the smallest change in the quantity being measured (input) of a measuring instrument that gives a perceptible change in the reading. |
| Uncertainty                    | The interval within the true value can be expected to lie.   |
| Variable                       | The spread of data, showing the maximum and minimum values of the data.  |
| Control variable               | Measurements where repeated measurements show very little spread.  |
| Dependent variable             | Information, in any form, that has been collected.   |

# Precise language

It is essential at AS and A-level to use precise language when you write reports and when you answer examination questions. You must always demonstrate that you understand a topic by using the correct and appropriate terms.

For example, you should take care when discussing bonding to refer to the correct particles and interactions between them.

Also, when discussing the interaction between particles in an ionic solid, you would demonstrate a lack of understanding if you referred to the particles as atoms or molecules instead of ions or the interaction between these ions as intermolecular forces rather than electrostatic forces. In this case, use of the incorrect terms would result in the loss of all the marks available for that part of a question.

Take care also to use the word 'chloride' and not 'chlorine' when referring to the ions in a compound such as sodium chloride. The word 'chlorine' should only be used for atoms or molecules of the element.

#### The periodic table

The periodic table of elements is shown on the back page of this booklet. The A-level course will build on what you've learned in your GCSE studies.

#### Activity 6

On the periodic table on the following page:

- Draw a line showing the metals and non-metals.
- Colour the transition metals blue.
- Colour the halogens yellow.
- Colour the alkali metals red.
- Colour the noble gases green.
- Draw a blue arrow showing the direction of periods.
- Draw a red arrow showing the direction of groups.
- Draw a blue ring around the symbols for all gases.
- Draw a red ring around the symbols for all liquids.

# **Activity 7**

Use the periodic table to find the following:

- 1. The atomic number of: osmium, sodium, lead, chlorine.
- 2. The relative atomic mass of: helium, barium, europium, oxygen.
- 3. The number of protons in: mercury, iodine, calcium.
- 4. The symbol for: gold, lead, copper, iron.
- 5. The name of: Sr, Na, Ag, Hg.
- 6. THInK can be written using a combination of the symbols for Thorium, Indium and Potassium (ThInK). Which combinations of element symbols could be used to make the following words?

AMERICA, FUN, PIRATE, LIFESPAN, FRACTION, EROSION, DYNAMO

# Activity 8: research activity

Research either:

The history of the periodic table

OR

The history of models of atomic structure.

Present your findings as a timeline. You should include the work of at least four people. For each, explain what evidence or experiments they used and how this changed the understanding of chemistry.

# Relative atomic mass $(A_r)$

If there are several isotopes of an element, the relative atomic mass will take into account the proportion of atoms in a sample of each isotope.

For example, chlorine gas is made up of 75% of chlorine-35  $^{35}Cl$  and 25% of  $_{17}$  chlorine-37  $^{37}Cl_{17}$ 

The relative atomic mass of chlorine is therefore the mean atomic mass of the atoms in a sample, and is calculated by:

$$A = (\underbrace{\frac{75.0}{100}} \times 35) + (\underbrace{\frac{25.0}{100}} \times 37) = 26.25 + 9.25 = 35.5$$

# **Activity 9**

- 1. What is the relative atomic mass of Bromine, if the two isotopes, <sup>79</sup>Br and <sup>81</sup>Br, exist in equal amounts?
- 2. Neon has three isotopes. <sup>20</sup>Ne accounts for 90.9%, <sup>21</sup>Ne accounts for 0.3% and the last 8.8% of a sample is <sup>22</sup>Ne. What is the relative atomic mass of neon?
- 3. Magnesiumhasthefollowingisotopeabundances: <sup>24</sup>Mg:79.0%; <sup>25</sup>Mg:10.0% and <sup>26</sup>Mg: 11.0%. What is the relative atomic mass of magnesium?

Harder:

- 4. Boron has two isotopes, <sup>10</sup>B and <sup>11</sup>B. The relative atomic mass of boron is 10.8. What are the percentage abundances of the two isotopes?
- 5. Copper's isotopes are <sup>63</sup>Cu and <sup>65</sup>Cu. If the relative atomic mass of copper is 63.5, what are the relative abundances of these isotopes?

# Relative formula mass (M<sub>r</sub>)

Carbon dioxide,  $CO_2$  has 1 carbon atom ( $A_r$  = 12.0) and two oxygen atoms ( $A_r$  = 16.0). The relative formula mass is therefore

$$M_r = (12.0 \times 1) + (16.0 \times 2) = 44.0$$

Magnesium hydroxide  $Mg(OH)_2$  has one magnesium ion ( $A_r$ = 24.3) and two hydroxide ions, each with one oxygen ( $A_r$ = 16.0) and one hydrogen ( $A_r$ = 1.0).

The relative formula mass is therefore:  $(24.3 \times 1) +$ 

 $(2 \times (16.0 + 1.0)) = 58.3$ 

# **Activity 10**

Calculate the relative formula mass of the following compounds:

- 1. Magnesium oxide MgO
- 2. Sodium hydroxide NaOH
- 3. Copper sulfate CuSO<sub>4</sub>
- 4. Ammonium chloride NH₄Cl
- 5. Ammonium sulfate (NH<sub>4</sub>)<sub>2</sub>SO<sub>4</sub>

#### **Common ions**

| Positive ion | ıs (cations)                 | Negative ions (anions) |                               |  |  |
|--------------|------------------------------|------------------------|-------------------------------|--|--|
| Name         | Symbol                       | Name                   | Symbol                        |  |  |
| Hydrogen     | H <sup>+</sup>               | Hydroxide              | OH <sup>-</sup>               |  |  |
| Sodium       | Na <sup>+</sup>              | Chloride               | Cl <sup>-</sup>               |  |  |
| Lithium      | Li <sup>+</sup>              | Bromide                | Br <sup>-</sup>               |  |  |
| Silver       | Ag <sup>+</sup>              | Oxide                  | O <sup>2-</sup>               |  |  |
| Magnesium    | Mg <sup>2+</sup>             | Hydrogencarbonate      | HCO <sub>3</sub>              |  |  |
| Calcium      | Ca <sup>2+</sup>             | Nitrate                | NO <sub>3</sub> <sup>-</sup>  |  |  |
| Zinc         | Zn <sup>2+</sup>             | Sulfate                | SO <sub>4</sub> <sup>2-</sup> |  |  |
| Aluminium    | Al <sup>3+</sup>             | Carbonate              | CO <sub>3</sub> <sup>2-</sup> |  |  |
| Ammonium     | NH <sub>4</sub> <sup>+</sup> | Phosphate              | PO <sub>4</sub> <sup>3-</sup> |  |  |

Some elements have more than one charge. For example, iron can form ions with a charge of +2 or +3. Compounds containing these are named Iron(II) and Iron(III) respectively.

Other common elements with more than one charge include: Chromium (II)

and chromium(III)

Copper(I) and copper(II)

Lead(II) and lead(IV)

# **Activity 11**

On the periodic table on the following page, colour elements that form one atom ions (eg Na $^+$  or O $^{2-}$ ) according to the following key:

| Charge | Colour |
|--------|--------|
| +1     | red    |
| +2     | yellow |
| +3     | green  |
| -1     | blue   |
| -2     | brown  |

 $Ionic compounds \, must \, have \, an \, overall \, neutral \, charge. \, The \, ratio \, of \, cations \, to \, anions \, must \, mean \, that \, there \, is \, as \, many \, positives \, as \, negatives.$ 

For example:

| NaCl            |     |  |  |  |  |
|-----------------|-----|--|--|--|--|
| Na <sup>+</sup> | CI- |  |  |  |  |
| +1              | -1  |  |  |  |  |

| MgO              |                 |  |  |  |  |
|------------------|-----------------|--|--|--|--|
| Mg <sup>2+</sup> | O <sup>2-</sup> |  |  |  |  |
| +2               | -2              |  |  |  |  |

| MgCl <sub>2</sub> |                 |  |  |  |
|-------------------|-----------------|--|--|--|
| 2.                | Cl <sup>-</sup> |  |  |  |
| Mg <sup>2+</sup>  | Cl <sup>-</sup> |  |  |  |
| +2                | -2              |  |  |  |

# Activity 12

Work out what the formulas for the following ionic compounds should be:

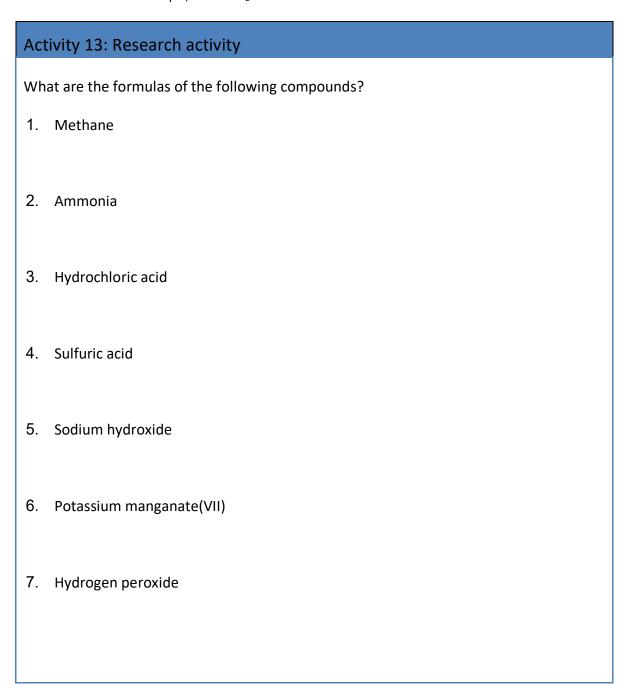

- 1. Magnesium bromide
- 2. Barium oxide
- 3. Zinc chloride
- 4. Ammonium chloride
- 5. Ammonium carbonate
- 6. Aluminium bromide
- 7. Iron(II) sulfate
- 8. Iron(III) sulfate

#### Diatomic molecules

A number of atoms exist in pairs as diatomic (two atom) molecules. The common ones that you should remember are:  $Hydrogen\,H_2, Oxygen\,O_2, Fluorine\,F_2, Chlorine\,Cl_2, Bromine\,Br_2, Nitrogen\,N_2\, and\,Iodine\,I_2$ 

# Common compounds

There are several common compounds from your GCSE studies that have names that do not help to work out their formulas. For example, water is  $H_2O$ .

# **Balancing equations**

Chemical reactions never create or destroy atoms. They are only rearranged or joined in different ways.

When hydrogen and oxygen react to make water:

hydrogen + oxygen  $\rightarrow$  water  $H_2 + O_2$ 

$$\rightarrow$$
 H<sub>2</sub>O

There are two hydrogen atoms on both sides of this equation, but two oxygen atoms on the left and only one on the right. This is not balanced.

This can be balanced by writing:

$$2H_2 + O_2 \rightarrow 2H_2O$$

The reactants and products in this reaction are known and you can't change them. The compounds can't be changed and neither can the subscripts because that would change the compounds. So, to balance the equation, a number must be added in front of the compound or element in the equation. This is a coefficient. Coefficients show how many atoms or molecules there are.

# **Activity 14**

Write balanced symbol equations for the following reactions. You'll need to use the information on the previous pages to work out the formulas of the compounds. Remember some of the elements may be diatomic molecules.

- 1. Aluminium + oxygen → aluminium oxide
- 2. Methane + oxygen → carbon dioxide + water
- 3. Aluminium + bromine  $\rightarrow$  aluminium bromide
- Calcium carbonate + hydrochloric acid → calcium chloride + water + carbon dioxide
- 5. Aluminium sulfate + calcium hydroxide → aluminium hydroxide + calcium sulfate
  Harder:
- 6. Silver nitrate + potassium phosphate → silver phosphate + potassium nitrate More challenging:
- 7. Potassium manganate(VII) + hydrochloric acid  $\rightarrow$

potassium chloride + manganese(II) chloride + water + chlorine

#### Moles

A mole is the amount of a substance that contains  $6.02 \times 10^{23}$  particles.

The mass of 1 mole of any substance is the relative formula mass ( $M_r$ ) in grams. Examples: One mole of carbon contains  $6.02 \times 10^{23}$  particles and has a mass of 12.0 g Two moles of copper contains  $12.04 \times 10^{23}$  particles, and has a mass of 127 g 1 mole of water contains  $6.02 \times 10^{23}$  particles and has a mass of 18 g

The amount in moles of a substance can be found by using the formula:

Amount in moles of a substance = mass of substance relative formula mass

# **Activity 15**

Fill in the table.

| Substance     | Mass of substance | Amount/moles | Number of particles      |
|---------------|-------------------|--------------|--------------------------|
| Helium        |                   |              | 18.12 × 10 <sup>23</sup> |
| Chlorine      | 14.2              |              |                          |
| Methane       |                   | 4            |                          |
| Sulfuric acid | 4.905             |              |                          |

# **Empirical formula**

If you measure the mass of each reactant used in a reaction, you can work out the ratio of atoms of each reactant in the product. This is known as the empirical formula. This may give you the actual chemical formula, as the actual formula may be a multiple of this. For example, hydrogen peroxide is  $H_2O_2$  but would have the empirical formula HO.

Use the following to find an empirical formula:

- 1. Write down reacting masses
- 2. Find the amount in moles of each element
- 3. Find the ratio of moles of each element

#### Example:

A compound contains 2.232 g of ion, 1.284 g of sulfur and 1.920 g of oxygen. What is the empirical formula?

| Element                   | Iron        | Sulfur      | Oxygen      |
|---------------------------|-------------|-------------|-------------|
| mass/relative atomic mass | 2.232/55.8  | 1.284/32.1  | 1.920/16.0  |
| Amount in moles           | 0.040       | 0.040       | 0.120       |
| Divide by smallest value  | 0.040/0.040 | 0.040/0.040 | 0.120/0.040 |
| Ratio                     | 1           | 1           | 3           |

So the empirical formula is FeSO<sub>3.</sub>

If the question gives the percentage of each element instead of the mass, replace mass with the percentage of an element present and follow the same process.

# Activity 16

Work out the following empirical formulas: 1. The smell of a pineapple is caused by ethyl butanoate. A sample is known to contain only 0.180 g of carbon, 0.030 g of hydrogen and 0.080 g of oxygen. What is the empirical formula of ethyl butanoate? 2. Find the empirical formula of a compound containing 0.0578 g of titanium, 0.288 g of carbon, 0.012 g of hydrogen and 0.384 g of oxygen. 3. 300 g of a substance are analysed and found to contain only carbon, hydrogen and oxygen. The sample contains 145.9 g of carbon and 24.32 g of hydrogen. What is the empirical formula of the compound? 4. Another 300 g sample is known to contain only carbon, hydrogen and oxygen. The percentage of carbon is found to be exactly the same as the percentage of oxygen. The percentage of hydrogen is known to be 5.99%. What is the empirical formula of the compound?
